

The Ultra Pure Microfiltration Difference

Why is Microfiltration of Ethanol Important?

Yes it is true that right after distillation, alcohol is in its cleanest form. Post distillation however, the alcohol travels through a series of fluid transfers that can result in contaminants such as metal oxides.

Distillation → Piping → Rail Cars → Piping → Holding Tanks → Piping → Filling Lines

Ultra Pure offers the purest GNS available today. We use a 0.25 micron filter at the point of filling which ensures these contaminants will be eliminated from your products.

Optional Triple Charcoal Filtration: The addition of charcoal filtration provides an added level of odor and flavor purity.
